The Open Mobility Foundation Principles

- **Open-Source** - Use open-source code and APIs to promote the formation of an ecosystem of private companies and public agencies who come together to build open-source code and APIs that can be use as the basis for products that manage and use the public right-of-way.

- **Competition** - Encourage the creation of competitive markets for commercial products and services based on the open-source projects within the Open Mobility Foundation.

- **Data and Privacy** - Foster a community that enables public agencies to generate data through the services they provide while also adhering to world-class privacy and data security standards.

- **Compatibility** - Create projects among all stakeholders that promote interoperability across borders and avoid a patchwork of regulations.

- **Sustainability** - Promote business models that ensure sustainable transportation networks for generations to come.

- **Modularity –** Create a flexible kit of parts and framework that public agencies may designate to fit their needs.
